

TRIPLE RISK MODEL FOR SIDS

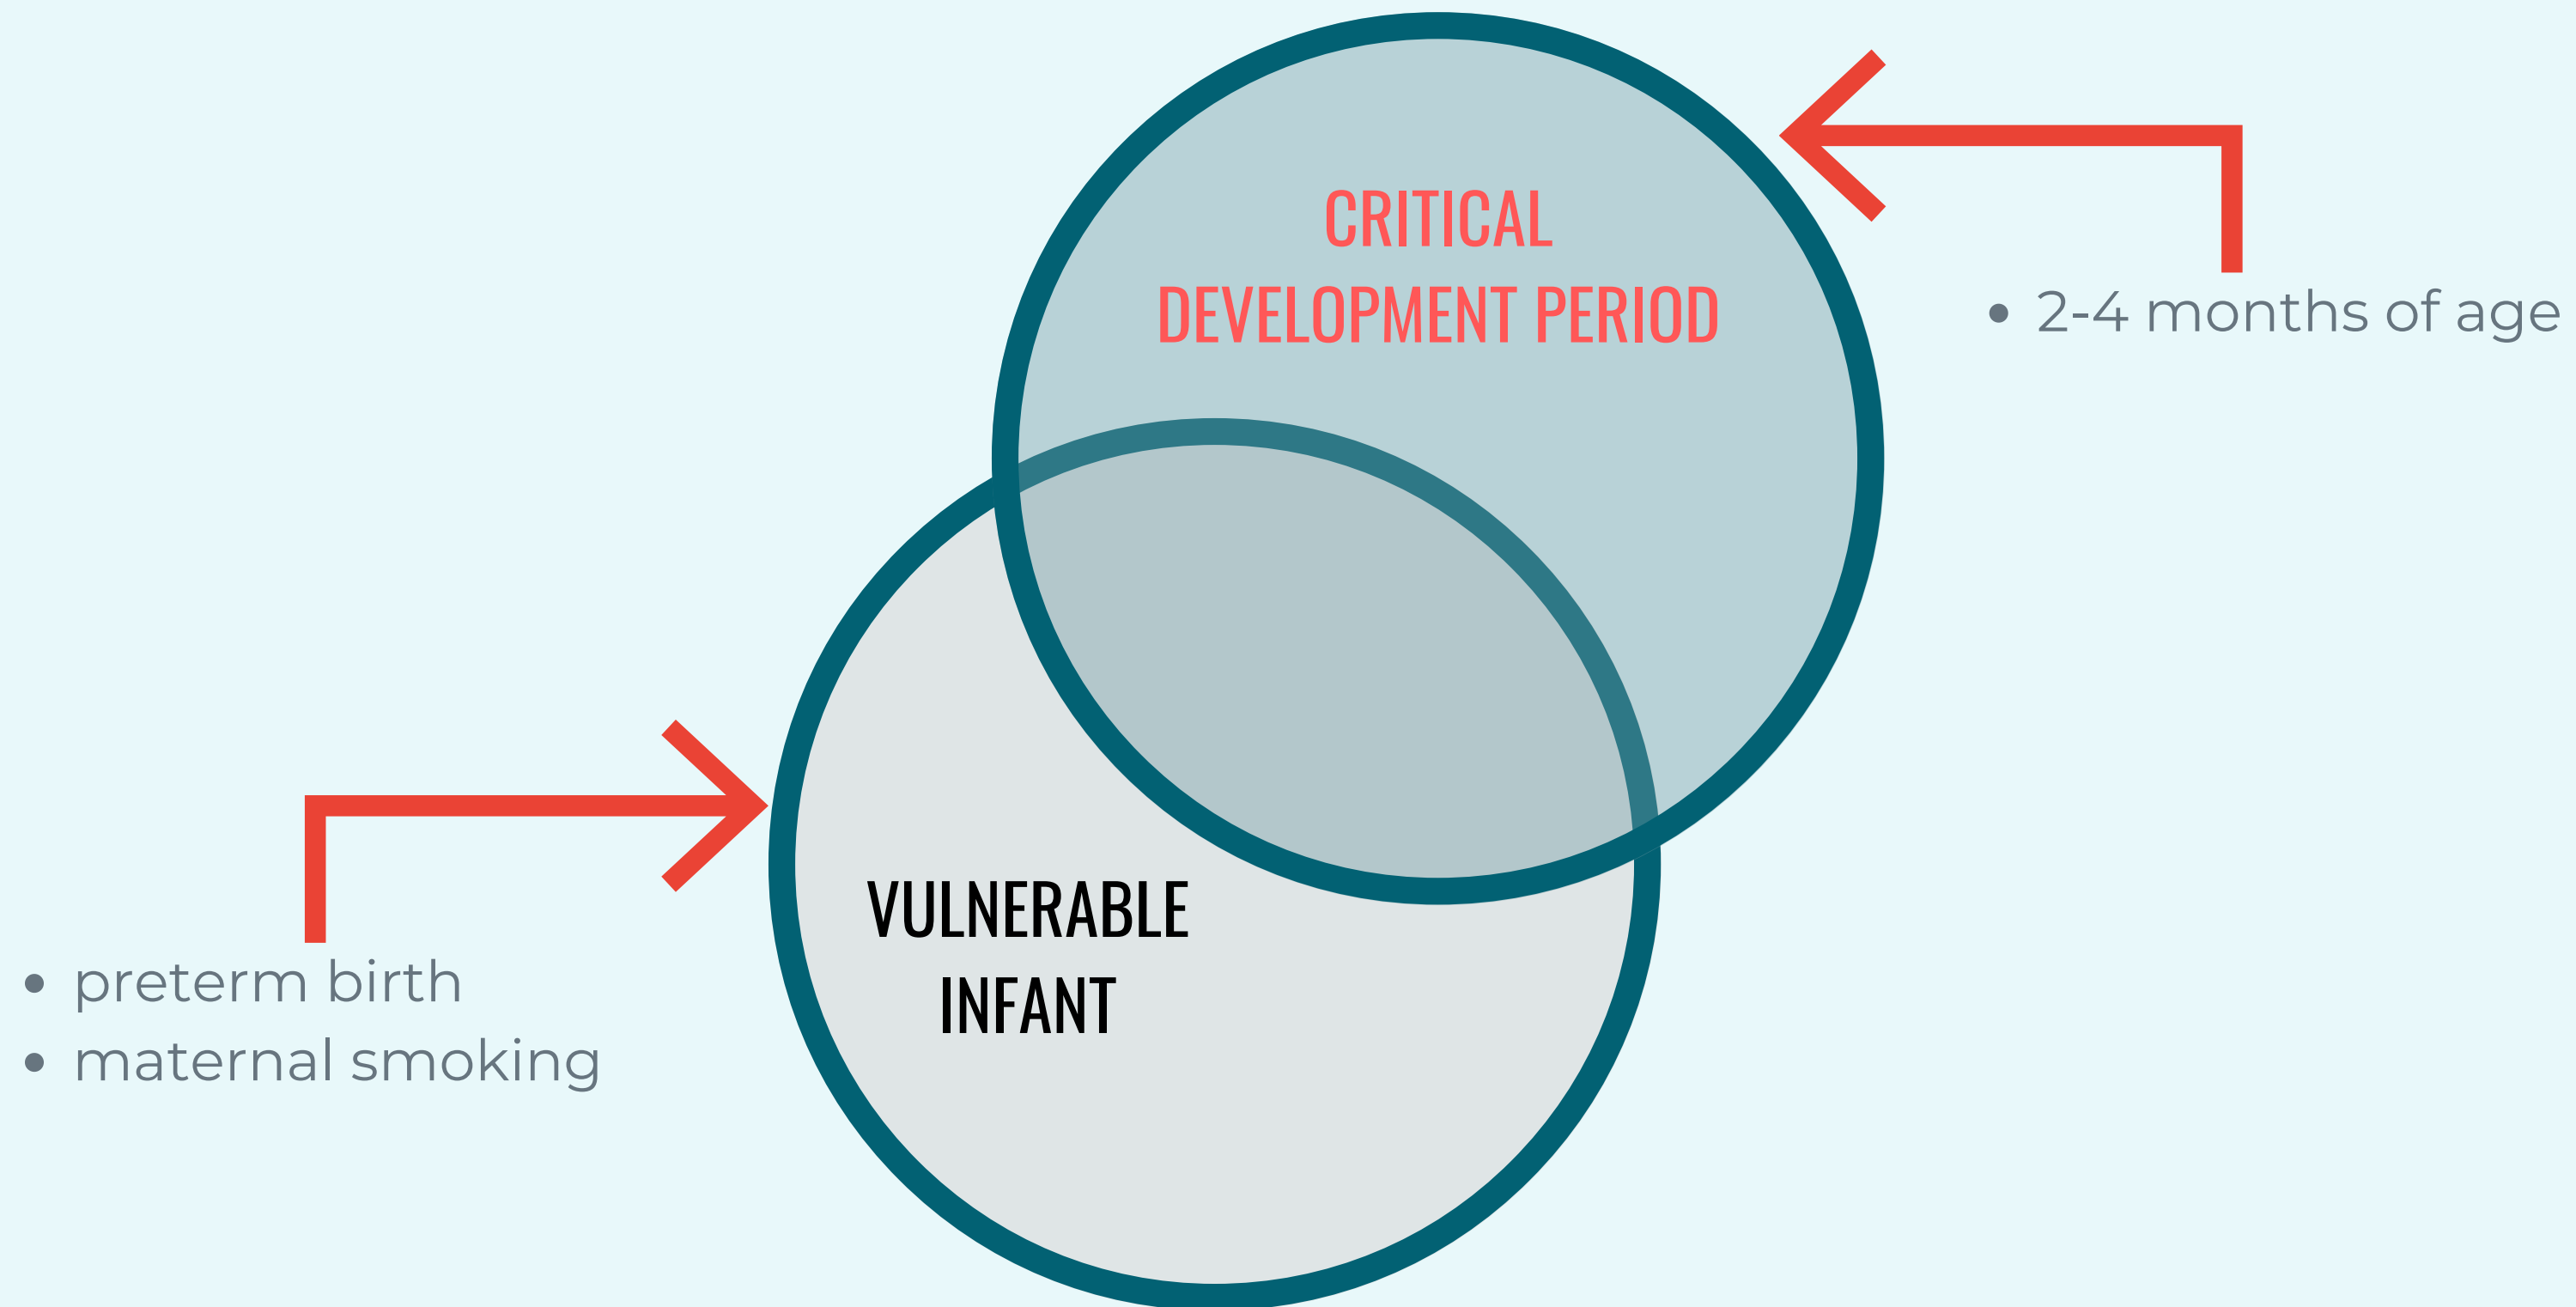

"The Triple Risk Model is a useful model to help understand how the risk factors for SIDS interact and may lead to an infant dying suddenly and unexpectedly. The Triple Risk Model poses that a **vulnerable baby** at a **critical period in development**, when exposed to an **external stressor with which they are unable to cope**, may die from SIDS."

Red Nose. National Scientific Advisory Group (NSAG). 2016. Information Statement: The Triple Risk Model. Melbourne, Red Nose. This information statement was first posted in July 2016. Last modified 7/1/2021.
